

## ARCCOS

### PURPOSE

Compute the arccosine for a variable or parameter.

### DESCRIPTION

The arccosine is the angle whose cosine is equal to the given value. The angle is limited to values between zero and  $\pi$ . By default, the angle is returned in radian units. To use degree values, enter the command ANGLE UNITS DEGREES (ANGLE UNITS RADIANS resets it). Values outside the range -1 to 1 generate an error message.

### SYNTAX

LET <y2> = ARCCOS(<y1>) <SUBSET/EXCEPT/FOR qualification>

where <y1> is a number, parameter, or variable;

<y2> is a variable or a parameter (depending on what <y1> is) where the computed arccosine value is stored;  
and where the <SUBSET/EXCEPT/FOR qualification> is optional.

### EXAMPLES

LET A = ARCCOS(-0.5)

LET X2 = ARCCOS(X1)

LET X2 = ARCCOS(X1-4)

### DEFAULT

None

### SYNONYMS

None

### RELATED COMMANDS

ARCCOSH	=	Compute hyperbolic arccosine.
ARCCOT	=	Compute arccotangent.
ARCCOTH	=	Compute hyperbolic arccotangent.
ARCCSC	=	Compute arcosecant.
ARCCSCH	=	Compute hyperbolic arcosecant.
ARCSEC	=	Compute secant.
ARCSECH	=	Compute hyperbolic arcsecant.
ARCSIN	=	Compute arcsine.
ARCSINH	=	Compute hyperbolic arcsine.
ARCTAN	=	Compute arctangent.
ARCTANH	=	Compute hyperbolic arctangent.

### APPLICATIONS

Trigonometry

### IMPLEMENTATION DATE

Pre-1987

## PROGRAM

```
X1LABEL COS(Y)
Y1LABEL ANGLE (RADIAN)
TITLE ARCCOS(X) FOR X = -1 TO 1
YLIMITS 0 3
YTIC OFFSET 0 0.2
PLOT ARCCOS(X) FOR X = -1 .01 1
```
